Lecture 28:

Course Wrap Up &
Project Presentation Tips

Parallel Computer Architecture and Programming
CMU 15-418/15-618, Spring 2015
Lana del Ray

Money Power Glory

(Ultraviolence)

“Final projects can be about a grade, or the chance to learn something new. But for me the Parallelism Competition is about…”

-Lana del Rey
Today

- Exam 2 discussion
- Parallelism competition hints/guidelines
- Wrap up: a few final comments about class topics
Announcements

- **Please fill out course evaluations**

- **Final project presentations: May 11th**
  - Parallelism competition finals:
    - 8:30-11:30am, Rashid Auditorium (with breakfast and snacks)
  - Additional parallel competition presentations:
    - Presentations the rest of the day in Smith Hall to course staff

- **Project reports due at 11:59pm that evening, no late days**
Exam 2 discussion (no slides)
Presentation format

- Each group has six minutes to talk
  - Plus 1-2 minutes for questions from judges
- Presentation format is up to you: slides, live demo, etc.
  - Start with name(s) of students, title of project on a title slide
  - Both students in a 2-person group should speak
- Present off your own laptop, or make arrangements with staff
Project presentation tips
Benefit TO YOU of a good (clear) talk *

- Non-linear increase in the **impact** of your work
  - Others are more likely to remember and build upon your work
  - Others are more likely to come up to you after the talk

- Clarity is highly prized: the audience remembers you
  - “Hey man, that was a great talk... are you looking for a job anytime soon?”
Your #1 priority should be to be clear, rather than be comprehensive
(your project writeup is the place for completeness)

Everything you say should be understandable by someone in this class. If you don’t think the audience will understand, leave it out (or change). (spend the time saying something we will understand)

This will be much harder than it seems.

Here are some tips to help.
1. Put yourself in your audience’s shoes

This is a major challenge for most technical speakers. (including professors)

(Tip: recite a sentence out loud to yourself. Do you really expect someone who has not been working with you everyday on the project to understand what you just said?)
Consider your audience

- Everyone in the audience knows about parallel programming
  - CS terminology/concepts need not be defined

- Most of the audience knows little-to-nothing about the specific application domain or problem you are trying to solve
  - Application-specific terminology should be defined or avoided

- The judges are trying to figure out the “most interesting” thing that you found out or did (your job is to define most interesting for them)
2.

Pick a focus.
Figure out what you want to say. Then say it.
(and nothing more)

A good speaking philosophy: “every sentence matters”

Tip: for each sentence, ask yourself:
What is the point I am trying to make?
Did the sentence I just say make that point?
Pick a focus

- In this class, different projects should stress different results
- Some projects may wish to show a flashy demo and describe how it works (proof by “it works”)
- Other projects may wish to show a sequence of graphs (path of progressive optimization) and describe the optimization that took system from performance A to B to C
- Other projects may wish to clearly contrast parallel CPU vs. parallel GPU performance for a workload

Your job is not to explain what you did, but to explain what you think we should know
The audience prefers not to think (much)
The audience has a finite supply of mental effort

- The audience does not want to burn mental effort about things you know and can just tell them.
  - They want to be led by hand through the major steps of your story
  - They do not want to interpret any of your figures or graphs, they want to be directly told how to interpret them (e.g., what to look for in a graph).

- The audience does want to spend their energy thinking about:
  - Potential problems with what you did (did you consider all edge cases?)
  - Implications of your approach to other things
  - Connections to their own work or project.
4.

Set up the problem. Establish inputs, outputs, and constraints (goals and assumptions)
Establish goals and assumptions early

- “Given these inputs, we wish to generate these outputs…”
- We are working under the following constraints:
  - Example: the outputs should have these properties
  - Example: the algorithm...
    - Should be real time
    - Must interoperate with this existing system
    - Must ascribe to this interface
  - Example: the system...
    - Need not compile all of Python, only this subset... (because for my domain that’s good enough)
    - Should realize about 90% of the performance of hand-tuned code, with much lower development time.
Basics of problem setup

- What is the computation performed (or system built)?
  - What are the inputs, and the outputs?

- Why does this problem stand to benefit from optimization?
  - “Real-time performance could be achieved”
  - “Researchers could run many more trials, changing how science is done”
  - “It is 90% of the execution time in this particular system”

- Why is it hard? (What made your project interesting? What should we reward you for?)
  - What turned out to be the hardest part of the problem?
  - This may involve describing a few key characteristics of the workload (e.g., overcoming divergence, increasing arithmetic intensity)
5.

Surprises* are almost always bad:
Say where you are going and why you must go there before you say what you did.

* I am referring to surprises in talk narrative and/or exposition. A surprising result is great.
Give the **why** before the **what**

- **Why** provides the listener context for...
  - Compartmentalizing: assessing how hard they should pay attention (is this a critical idea, or just an implementation detail?). Especially useful if they are getting lost.
  - Understanding how parts of the talk relate (“Why is the speaker now introducing a new optimization approach?”)

- In the algorithm/system description section:
  - “We need to first establish some terminology…”
  - “Even though I just told you our solution to X, the problem we still haven’t solved is…”
  - “Now that we have defined a cost metric we need a method to minimize it…”

- In the results section:
  - Speaker: “Key questions to ask about our approach are…”
  - Listener: “Thanks! I agree, those are good questions. Let’s see what the results say!”
6.

How to describe a system
How to describe a system

- Start with the nouns (the key boxes in a diagram)
  - Major components (processors, memories, interconnects, etc.)
  - Major entities (particles, neighbor lists, pixels, pixel tiles, features, etc.)
  - What is state in the system?

- Then describe the verbs
  - Operations that can be performed on the state (update particle positions, compute gradient of pixels, traverse graph, etc.)
  - Operations produce, consume, or transform entities
7.

Always, always, always explain any figure or graph

(remember, the audience does not want to think)
Explain every figure

- Explain every visual element used in the figure (never make the audience decode a figure)
- Refer to highlight colors explicitly (explain why the visual element is highlighted)

Example voice over: “Here I’m showing you a pixel grid, a triangle, and the location of four sample points at each pixel. Sample points falling within the triangle are colored red.”
Example voice over: “Now I’m showing you two adjacent triangles, and I’m coloring pixels according to the number of shading computations that occur at each pixel as a result of rendering these two triangles. As you can see in the light blue region, pixels near the boundary of the two triangles get shaded twice.”
Explain every results graph

- May start with a general intro of what the graph will address.
- Then describe the axes (your axes better have labels!)
- Then describe the one point that you wish to make with this results slide (more on this later!)

Example voice over: “Our first question is about performance: how much did merging reduce the number of the shaded pixels? And we found out that the answer is a lot. This figure plots the number of shading computations per pixel when rendering different tessellations of the big guy scene. X-axis gives triangle size. If you look at the left side of the graph, which corresponds to a high-resolution micropolygon mesh, you can see that merging, shown by yellow line, shades over eight times less than the conventional pipeline.”
8.

In the results section:
One point per slide!
One point per slide!
One point per slide!

(and the point is the title of the slide!!!)
Merging reduces total shaded quad fragments
1/2-pixel-area triangles: 8x reduction

Big Guy Scene

No merging
Merging

Shading computations / pixel (avg)

Average triangle area (pixels)

Extra shading occurs at merging window boundaries
1/2 pixel area triangles

For micropolygons: factor of eight across scenes
1/2 pixel area triangles

Average improvement: 8.1x

Nearly identical visual quality
Quad-fragment merging
Current GPU (no merging)

Differences exist near silhouettes

Difference image (10x intensity)
Place the point of the slide in the title:

Provide context for interpreting the graph

(Listener: “Let me see if I can verify the point in the graph to check my understanding”)

Another example of the “audience prefers not to think” principle
Bad examples of results slides

- Notice how you (as an audience member) are working to interpret the trends in these graphs
  - You are asking: what do these results say?

- You just want to be told what to look for
Titles matter.

9.

If you read the titles of your talk all the way through, it should be a great summary of the talk.

(basically, this is “one-point-per-slide” for the rest of the talk)
Examples of good slide titles

The reason for meaningful slide titles is convenience and clarity for the audience

Audience: “Why is the speaker telling me this again?”

(Why before what.)
10. Provide evidence that you’ve done a good job (You have successfully applied principles learned in 418/618 to a problem of your choosing)

(This is a 418/618 specific tip, but it certainly generalizes to other contexts as well.)
Evaluating results

(Show your system is fast, or efficient, or as good as it can be
... in other words, that you did a good job)

- Compare against published results
  - “Our code is 10% faster than this publication”

- Determine a fraction of peak
  - “We achieve 80% of peak performance on this machine”

- Be truthful about comparisons between a CUDA implementation utilizing an entire GPU and single threaded, non-SIMD C program on a CPU (I’d rather not hear the conclusion: “GPU is 300x faster than the CPU”.)
11.

Practice the presentation
Practice the presentation

- Given the time constraints, you’ll need to be smooth to say everything you want to say

- To be smooth you’ll have to practice

- I hope you rehearse your demo or presentation several times the night before (in front of a friend or two that’s not in 418)

  - It’s only a 6 minute talk. So a couple of practice runs are possible in a small amount of time
Course wrap up
For the foreseeable future, the primary way to obtain higher performance computing hardware is through increased parallelism and hardware specialization.
Today’s software is surprisingly inefficient compared to the capability of modern machines.

A lot of performance is currently left on the table (increasingly so as machines get more complex, and parallel processing capability grows).

Extracting this performance stands to provide a notable impact on many compute-intensive fields (or, more importantly enable new applications of computing!)

Given current software programming systems and tools, understanding how a parallel machine works is important to achieving high performance.

A major challenge going forward is making it simpler for programmers to extract performance on these complex machines.
Efficiency matters more, not less!
Key issues we have addressed this semester

Identifying parallelism
(or conversely, identifying dependencies)

Scheduling parallelism
1. Achieving good workload balance
2. Overcoming communication constraints:
   Bandwidth limits, dealing with latency, synchronization
   Exploiting locality in data or execution = managing state!

We addressed these issues at many scales and in many contexts

Single chip, multi-core CPU
Multi-core GPU
CPU+GPU connected via bus
Large scale, multi-node supercomputer
Collection of machines in cloud
Other classes with overlapping topics

- Computer Graphics (15-462: I will teach in Fall 2015 *)
- Computer architecture (18-447)
- Compilers (15-441)
- Distributed computing (15-447)
- Operating systems (15-410)

* My visual computing systems grad class will be taught again in Fall 2016
TAs and independent study!

- We will be looking for TAs for next Spring’s version of the course!
  - This is important, since we need great TAs in this course to be successful
  - Email me if interested!

- Students that did well in 418/618 have a great foundation for moving on to independent study or research in parallel computing
  - A good timeline: Indicate interest soon, contact me in early August before you’re back from an internship.
  - The best way to indicate interest: do a great project (it’s a chance to show what you can do on your own)
  - I can tell you about my projects or point you at other faculty that have interesting 418-related as well
Beyond assignments and exams

- Come talk to me (or other professors) next fall about participating in research!
- Consider a senior thesis!
- Pitch a seed idea to Project Olympus
- Get involved with organizations like Hackathon or ScottyLabs
Kayvon's Final Claim
It is far more difficult (and creative) to deliver on a “once in a few years” final project in 15-418/618 than it is to take an extra class.

Ditto for pursuits like senior theses, independent study, starting a company...
The world rewards initiative.

The world rewards risk takers.
(Force yourself to get comfortable with risk taking and the possibility of occasional failure while at CMU.)

Many people are really smart.
Many people can work really hard.
Far fewer people develop the confidence and creativity to lead.
Thanks for being a great class!

Good luck on projects. Expectations are high.

See you a week from Monday!
